

The SpaceNavigator™ from 3DConnexion encompasses the functionality of flying with the "BAT" in a compact affordable unit. This does not replace the bat but instead offers a new mode of navigation. Approximately 80% of users will find its usage great for navigation and movie making where 20% will still prefer the 6 degree of freedom the BAT gives them. Through pressure sensing technology, the SpaceNavigator™ is a virtual extension of you within the 3D environment of Fledermaus.

Push, pull, twist or tilt the cap a fraction of inch to simultaneously pan, zoom and rotate within the Fledermaus scene. Increase pressure to go fast or decrease pressure to make intricate adjustments. Movie making and all around navigation has been taken to whole new level.

The key advantage of a SpaceNavigator™ over a mouse and keyboard is the ease of performing intricate adjustments to camera views and models with out repeatedly stopping to change directions, zoom, or rotate models. With a SpaceNavigator™ you can do all three at once.

Support for Fledermaus is ready to go with a simple driver install, so you can instantly circumnavigate the globe, hover or move up and down like a helicopter, fly through 3D scenes and layers with precision and ease.

“3D Visualization – more than just a pretty picture”
